Cleveland Cascades Shiploader Handling Fish Feed Pellets

Bearbeitet von am 1. Nov. 2023

Cleveland Cascades Shiploader handling Fish Feed Pellets at a rate of 300tph in Myre, Norway. There was a strict requirement to prevent product degradation of the feed pellets, and as you can see in the video this is effectively achieved. The product flows well through the system at the desired rate, and the pellets do not break up or become damaged.

Utilising an innovative system of inclined cones, the Cascade system controls the descent of dry bulk material through the chute which largely eliminates dust emissions at source and minimises both product segregation and product degradation.
