Vibrating Conveyor - large pan & trough design

Edited by on 20. Dec. 2023

This type of Vibrating Conveyor has a large pan and trough and is used to convey heavy, abrasive and very hot materials for bulk processing systems. They are also used to convey solids for a wide array of applications, including aggregates, minerals, sand, coal, ash, ore, castings, molds, pharmaceuticals and food products.

Standard sizing options are available, as well as, custom-engineered products tailored to fit specific customer requirements. Vibrating conveyors also allow additional processes such as cooling, heating, or coating to be accomplished while transferring materials. Curved conveyors can be added to an existing conveyor system. Conveyor speed can be adjusted to match infeed and exit conveyor conveying rate.
