Kleemann: Configuration Tool for quick, optimal Machine Settings

Edited by on 29. Jun. 2023

Windhagen, Germany –

Different machines, different settings – so that users can find solutions quickly and easily, Kleemann now offers the Smart Job Configurator in the SPECTIVE operating concept. The configurator enables the optimal machine settings to be easily determined.

The "Smart Job Configurator" in the SPECTIVE CONNECT app from Kleemann supports the operator in the selection of the correct machine settings. (Pictures: ©Wirtgen Group)

Finding the ideal machine parameters takes time and requires experience. The applications for crushing plants are diverse and depending on the feed material and the desired end result the parameters vary. The Smart Job Configurator is

part of the SPECTIVE CONNECT app and the SPECTIVE touch display and supports operators in the selection and entry of the correct settings. This ensures that the desired high-quality final product is reached with the lowest possible wear and fuel consumption.

Simple Handling thanks to intuitive User Guidance

The operator is guided step by step through the menu of the Smart Job Configurator of the SPECTIVE CONNECT app and enters the necessary data of their planned application, such as details about the machine, material and its processing. A suitable final product is suggested as well as the tools required. When all parameters are entered, the tool creates an overview of the ideal machine configurations. The result of the calculations can be exported as a PDF and sent to other people, for example.

On the SPECTIVE touch panel the suggested settings can be applied quickly and simply via the Smart Job Configurator menu. The machine now works exactly with the applied setting and delivers the planned result.

On the SPECTIVE touch panel the Smart Job Configurator can be used as a "QuickStart" for simple set-up of the Kleemann machine.

The Smart Job Configurator can also be used without SPECTIVE CONNECT as a "QuickStart" on the touch panel. The operator is guided step by step through the machine configuration, which accelerates the set-up. The operator receives the same setting options that are offered in the app.

Different Sample Applications

The Smart Job Configurator is fed with various application scenarios, which were created by the Kleemann application technology. More "recipes" are gradually being added. There operators find an ever-expanding range of various applications. The customers can also contact Kleemann directly if special

applications are required.

With this support for the machine setting employees with less experience also find the appropriate solution and experienced users benefit from time savings. The material processing is simple and efficient for all users.
